auto scaling group & related resources

when creating new auto scaling group

☐ exists or new ☐ new ☐ not exists

Scaling Policies

Target Tracking Scaling

Depends on cloud watch metric value to scale up **and** down the EC2s

increase instances one by one

cloud watch alarms will be created on your behalf

Step Scaling

Depends on cloud watch metric value to scale up **or** down the EC2s

increase instances by specific count according to metric values

could have more than one step

you need to create the alarm yourself

Simple Scaling

Depends on cloud watch metric value to scale up **or** down the EC2s

increase instances by specific count whatever the metric value

just one rule

you need to create the alarm yourself

Predictive Scaling

Scale daily or weekly according to traffic flow

using machine learning based on cloud watch historical data

auto scaling group creation (console)

- create launch template
- create auto scaling group with load balancer
 - select launch template
 - select same vpc that configured in the template
 - attach to a new load balancer
 - network load balancer
 - internet-facing
 - configure tcp port and target group
 - no VPC Lattice
 - enable load balancer health check
 - configure group size (desired, minimum and maximum capacity)
 - enable target tracking scaling policy
 - average cpu utilization
 - configure target value
 - no notification
 - no tags

auto scaling group creation (cli)

Ingredients:

- VPC
- Subnets
- Security Group
- Launch Template
- Load Balancer
 - Listener
 - Target Group
- Auto Scaling Group
- Scaling Policies

Directions:

- Create VPC, Or retrieve the Id of existing one
- Create at least 2 Subnets, Or retrieve their Ids
- Create Security Group, Or retrieve Id.
- Create Launch Template, Or use existing one's name.
- Create Load Balancer or retrieve ARN.
 - Create Listener or just use existing one
 - Create Target Group or retrieve ARN.
- Create Auto Scaling Group
- Attach Scaling Policies to the scaling group
